Overview

Compared to the vast majority, capacitor attachment via conductive epoxy is not a common technique among end-user applications. A significant amount of growth in capacitor usage has occurred in solder attachment methods. Furthermore, many publications on attachment methods focus predominantly on. Conductive Epoxy Attachment Basics Conductive Epoxy attachment is an alternative attachment method of soldering. As the name indicates, a conductive glue. For decades electrically conductive epoxies have been used as an assembly method in applications such as microelectronics, lead frames, and hybrid. When selecting SMT components, extreme care must be exercised in conductive epoxy applications since not all SMT component terminations are compatible with conductive epoxy attachment. Terminations compatible with conductive epoxy consist of Ti/W/Au, Ti/W/Ni, AgPd, CuAu, NiAu, ENIG, and ENEPIG. RoHS accepted Sn and SnPb. SMT components used in conductive epoxy processes must be compatible with the hydroscopic nature of electrically conductive epoxies. Conductive epoxy attachment offers a very low stress, low-temperature attachment method of creating end circuitry. Several important trends in SMT component technology are emerging, possibly.

Surface Mount, MLCC, Epoxy Ceramic Capacitors

A capacitor is a passive electronic device that stores electric charge. Ceramic capacitors consist of two or more alternating layers of ceramic material as the dielectric and metal layers acting as the non-polarized electrodes. Applications include automotive, bypass, decoupling, filtering, RF, and ESD protection.
