

Classification of compressed air energy storage systems

Overview

Decarbonization of the electric power sector is essential for sustainable development. Low-carbon generation technologies, such as solar and wind energy, can replace the CO₂-emitting energy sources (1). The Egypt Climate Agreement and the Glasgow Climate Pact, forged by the United Nations, emphasize the need for such technologies. 2.1. Conventional CAES description The first CAES plant was built in 1978 by BBC Brown Boveri with the term “Gas Turbine Air Storage Peaking Plant” at Huntorf, Germany. Generally, there are two types of CAES coupling systems: One is CAES coupled with other power cycles (e.g., gas turbines, coal power plants, and renewable energy), and the other is standalone. In this section, the characteristics of different CAES technologies are compared and discussed from different perspectives, including the technical maturity level, power/energy capacity. CAES is a long-duration and large-scale energy-storage technology that can facilitate renewable energy development by balancing the mismatch between generation and load.
