

Inverter connected to DC string

Overview

A string inverter is a type of solar inverter that connects a series of solar panels, known as a “string”, and converts the total DC output into usable AC power. It's called a “string” inverter because it manages a group—or string—of solar modules wired together in series. You have the option of operating the DC inputs A and B in parallel, and therefore of connecting several strings to the inverter. Solar panels naturally produce direct current (DC) electricity, but your home and the electrical grid use alternating current (AC). Proper voltage calculation, accurate DC and AC wiring, and compliance with electrical standards all play a critical role in maximizing solar. A complete guide to string connected grid inverter would cover a variety of topics, from basic concepts to installation procedures, operating principles, maintenance, and troubleshooting.
