

Lithium iron phosphate bms

Overview

A LiFePO₄ BMS (Battery Management System) is an electronic control unit specifically designed for lithium iron phosphate battery packs. It acts as the brain of your battery, constantly monitoring voltage, current, temperature, and cell balance to ensure safe and efficient. LiFePO₄ cells have gained significant popularity in various applications, ranging from electric vehicles to renewable energy storage systems. These lithium iron phosphate cells offer numerous advantages, including high energy density, long cycle life, and enhanced safety. But what is it, and why is it so crucial?

This beginner-friendly guide explains everything you need to know about the battery. LFP is the safest of the mainstream li-ion battery types. The nominal voltage of a LFP cell is 3,2V (lead-acid: 2V / cell). A 12,8V LFP battery therefore consists of 4 cells connected in series; and should not be discharged too deeply or overcharged, but not immediately. Today, they're in portable designs.
